

Cleaning the Coronado Personal Solar Telescope

The glass in the telescope tube should **NEVER** be cleaned. A little dust won't impact your viewing (*though do remember to keep the cap on when not in use to avoid too much accumulation!*) If cleaning is needed, using an air can to blow out dust is the preferred method. Should something stickier end up inside, you can use a dry microfiber cloth (*like eyeglass cleaning cloths*) but should avoid scrubbing or touching clean areas as this will ruin the telescopes protective coating.

Telescope body and tripod can be cleaned with wipes (*such as Clorox or alcohol wipes*)

Rubber end of eyepiece can be cleaned with wipes (*such as Clorox or alcohol wipes*)

Eyepieces, end of telescope tube, and eyepiece slot should always have dust covers on when not in use.

If the eyepiece is obstructed by a fingerprint or other gooey mess, clean with a dry microfiber cloth, but avoid if not necessary.
